

ENTERPRISE DECISION INTELLIGENCE

High-stakes decisions still take weeks - and miss what matters.

M&A diligence, vendor evaluation, internal audit, compliance review, investment analysis, and board reporting still depend on manual, cross-team reading of enormous document sets. A typical data room holds thousands of pages. Recommendations reach executives only after days or weeks of duplicated effort - and critical contradictions still slip through.

Four structural failures

Speed vs. risk

Rushing misses red flags; thoroughness delays decisions and can lose deals.

Duplication across silos

Legal, finance, and compliance re-read the same files with little shared state.

Fragmented signals

A buried clause can contradict a board-deck claim - with no single owner of the full picture.

Untrustworthy AI shortcuts

Generic chat tools lack a data-room workflow, mandatory citations, and auditable multi-perspective reasoning.

Root causes: duplicated effort, missed contradictions, slow decision cycles, and black-box AI that cannot show its evidence trail. Enterprises need weeks compressed into minutes - without shipping sensitive deal data to opaque third-party APIs, and without sacrificing auditability.

Who feels the pain

- PE / IB analysts - deal data rooms under deadline
- Corp Dev - acquisition target analysis
- CFO / Finance - anomalies found too late
- Legal counsel - clause risk buried in PDFs
- Compliance - manual framework mapping
- Auditors - slow evidence gathering
- Procurement - incomplete vendor picture
- Executives - analyst bottleneck before board prep

THE PLATFORM

NexusIQ-AI: diligence intelligence in minutes.

A local-first AI enterprise decision-intelligence platform. Upload an entire company data room; the system runs financial, legal, compliance, risk, and fraud analysis, surfaces contradictions and missing documents, produces executive reports, and supports cited Q&A and what-if simulation - on local infrastructure via Ollama, with zero paid AI API cost.

How intelligence flows

Differentiator: every factual claim is designed to carry citations to source chunks, a confidence signal, and - when agents disagree - visible dissent plus a resolution rationale. Consensus is never a black box.

End-to-end journey

- 1 Create workspace and project (deal, audit, or vendor review).
- 2 Upload the data room - folders, bulk upload, OCR where needed.
- 3 Classify, extract, chunk, embed, and index for search.
- 4 Run specialist agents; consensus synthesizes an explainable recommendation.
- 5 Explore chat, reports, graph, gaps, simulator, and actions - then export.

HOW AI SOLVES IT

Retrieval-first, multi-agent, and explainable

NexusIQ-AI is not a single chatbot over PDFs. Documents are classified, extracted, chunked, and embedded locally. Agents and chat retrieve evidence first, then reason - reducing hallucination and making citations first-class.

SPECIALIST AGENTS

Financial

Legal

Compliance

Risk

Fraud

Executive

Consensus

- Contradiction engine validates inconsistencies against retrieved source text on both sides.
- Missing-info engine maps uploads to project-type checklists and compliance gaps.
- Risk simulator explores scenarios over completed financial and risk runs via grounded RAG.
- Local Ollama, PostgreSQL, and filesystem keep sensitive materials under operator control.

Why it matters in industry

Buyer / role	Value
PE / IB / Corp Dev	Compress data-room diligence; surface financial and contractual red flags earlier.
Legal	Scan clause risk and liability patterns with source citations.
Compliance / Audit	Gap analysis, evidence trails, contradiction and missing-document coverage.
CFO / Finance	Anomalies, concentration, and health signals before the earnings or audit cycle.
Procurement	Vendor risk and incomplete information before contract commitment.
Executives / Boards	Cited memos and risk heatmaps without a multi-week analyst bottleneck.

NexusIQ-AI attacks the diligence bottleneck at its root: too many documents, too many silos, too little shared evidence. Retrieval-first local AI, specialist agents, and explainable consensus turn weeks of review into a minutes-scale intelligence session - faster decisions, fewer missed risks, and outputs organizations can actually defend.
